I would appreciate the search for:

SEQ ID NO: 1 and 2. Application No. 09/833,782, the earliest priority is 4/12/2000. Please use the pending and commercial data bases. Please RUSH!

Thank you, Malgorzata Walicka Art Unit 1652 tel.305-7270 Mali box 10C01 Room 10D06

Christina, could you authorize this rush search?

Thank you,

Malgorzata

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents cDNA encoding a novel human aminopeptidase, designated 22196. cDNA clones encoding human aminopeptidase 22196 were identified in a bone marrow cDNA library using an EST (expressed sequence tag) selected on the basis of homology to aminopeptidase 22196 is thought to be a metalloenzyme, as it contains a zinc-binding region signature found in neutral zinc metallopeptidases. Expression analysis indicated that the aminopeptidase is highly expressed in normal osteoblasts, testis, skeletal muscle, foetal kidney and foetal liver. It is also expressed in normal brases, lung, and colon tissue, and is overexpressed in lung and colon cancer. Expression was found to be downregulated during stromal cell osteoblast lineage naturation. Aminopeptidase 22196 may be used to treat pain, and cancers of the lung and colon. It can also be used in drug screening to identify compounds which bind to it and modulate its activity. Such compounds may be used in the treatment of a wide variety of conditions, including and colon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      consequence of a variety of controlled in the control of seases (e.g., splenomegaly); infectious diseases (e.g., malaria, tuberculosis); immune disorders (e.g., rheumatoid arthritis, systemic lupus erythematosus, acquired immunodeficiency syndrome (AIDS)); lung disorders (e.g., pulmonary embolism, emphysema, bronchial asthma; colon disorders (e.g., diarrhosa, Crohn's disease, ulcerative colitis); liver disorders (e.g., hepatic cirrhosis, hepatitis); uterine disorders (e.g., diarrhosa, crohn's disease, meningitis, Alzheimer's disease, Parkinson's disease, Huntington's disease); skin disorders (e.g., wholligo urticaria, skin tumours, psoriasis); cardiac and sacchat disorders (e.g., myocardial infarction, chronic ischaemic heart disease, hypertension, atherosclerosis); and one disorders (e.g., osteoporosis, Paget's disease).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                The rabbit endopeptidase was purified from rabbit liver and digested with CNBr. Families of degenerate primers were designed based on the amino acid sequences of the CNBr fragments. The primers were used to amplify sequences from a rabbit cDNA library. An amplified fragment was isolated and used to probe the same library. Two overlapping clones produced a 2148bp sequence. A preliminary sequence are unassigned; the actual amino and 5' and 3'-most sequences are unassigned; the actual amino and carboxil terminals of the protein have not yet been determined. The short untranslated 5' and 3' sequences are primer sequences see AAR26107-R26113 and AAQ27305-Q27307.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a

S

CC polynucleotide which comprises a 3'-end sequence, where the cligonucleotide comprises at least 15 nucleotides and the combination of the sequence's'-end sequence! is selected from those defined in the sequence's'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CC chefull-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13639 represent human cDNA sequences; AAH36246 to AAH95893 represent human amino acid sequences; and AAH13629 to AAH13632 corpresent oligonucleotides, all of which are used in the exemplification XX Sequence 1658 BP; 508 A; 308 C; 374 G; 468 T; 0 other;

```
The complete sequence of the human amyloidin gene was obtained by sequencing two clones: clone cHL57 (codons 1-480) and clone cHL53 (codons 1-480) and clone cHL53 (codons 1-480) and clone cHL53 long two clones: clone cHL65 (codons 1-480) and clone cHL63 (codons 1-480) and clone cHL63 superior cannot be colored to the following sources: normal human brain, superior temporal gyrus and human embryonic kidney cell line 293. Examination of the nucleotide sequence reveals that there is no clear hydrophobic leader sequence. The deduced amino acid sequence of the amyloidin protease contains the motif X-H-E-F-G-H-X at the active site typical of zinc-dependent metallopeptidases; the two histidine residues coordinate the Zn (2+) in the active centre and the glutamate is involved in bond-breaking.
                                                Human amyloidin protease – used for cleaving Met-Asp bond :
amyloid-like substrate for identifying protease inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the glutamate is involved in bond-breaking.

The present invention describes primer sets for synthesising 5602
[ull-length cDNAs defined in the specification. Where a primer set
comptriess: (a) an oilgo-dr primer and an oilgouncleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence complementary to a
polynucleotide which comprises a 3'-end sequence complementary to a
polynucleotide which comprises as 1'-end sequence, where the
oligonucleotide comprises at least 15 nucleotides and the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in
the 5'-end sequence/3'-end sequence is selected from those defined in
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length without any specialised methods. AAH1318 and
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to

The present invention describes a library of polynucleotides comprising not by a pulled sequences (given in AAH30067 to AAH3145). Also described are: (1) an isolated polynucleotide (1) having at least 90% identity to one of the 1079 sequences; (2) a recombinant host cell containing (1); (3) an isolated polypeptide (11) encoded by (1); (4) an antibody that specifically binds to (11); (5) a vector comprising (1); and (6) a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell comprising detecting a gene product encoded by 65 fthe 1079 sequences given in the specification. The polynucleotides are used to monitor patients having (or susceptible) to cancer to detect potentially malignant events at a molecular level before they are contextable at a gross morphological level. The polynucleotides are also useful for monitoring the efficacy of various therapies and preventive interventions. Polynucleotide probes based on the disclosed sequences are used to useful for chromosome mapping and detection of transcription levels. The 1079 polynucleotide sequences were derived from a human colon cancer colon line Km12L4-A cDNA library.

proteins, called pancreatic cancer antigens, given in AAB54008 to
AAB54466. The human pancreatic cancer antigens have cytostatic,
concurportective, nootropic, immunomodulatory, relaxant, contraceptive,
concurportective, nootropic, immunomodulatory, activities, and can be used
concurportective, nootropic, immunomodulatory, activities, and can be used
concurportective, nootropic, and antiinflammatory activities, and can be used
concurportective, nootropic, and antiinflammatory activities, and can be used
concurportective, nootropic, and proteins and be used for
concurportective, nootropic, and call of the antigens and the activity of the
concurportective and antigens to the proteins and the activity of the
concurportective and antigens to the antigens can be used to design nucleic
concurportective antigen polynucleotides can be used to design nucleic
acid hybridisation probes that can be used in chromosome mapping, linkage
and liagnostic methods. The proteins can be used to generate antibodies
which are used to purify, detect and target the polypeptides, including
contrains can be used to purify the proteins can detect and therapeutic methods. The
contrains can be used to purify the proteins can detect and therapeutic methods. The
contrains can be used to purify the protein contrains to the proteins can detect and therapeutic methods. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  proteins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AAC99232 to AAC99240 and AAB54467 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                 Human; pancreas; pancreatic cancer; pancreatic cancer antigen; detection; diagnosis; identification; cytostatic; neuroprotective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAC98773 to AAC99231 encode the human pancreatic cancer associated
                                                                                                                                                                                     Human pancreatic cancer antigen nucleotide sequence SEQ ID NO:25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 900 BP; 160 A; 284 C; 299 G; 147 T; 10 other;

The invention relates to a computer readable medium (CRM) having recorded upon it the Complete H.influenzae nucleotide sequence (I), a representative fragment of (I) or a nucleotide sequence in a computer readable form, it is possible to identify commercially important nucleic acid fragments and expression modulating fragments (EMFs) of the Haemophilus genome. The EMFs can be used to required the expression of a nucleic acid molecule. Vectors and altered organisms comprising the predicted ORFS can be used to produce any of the polypeptide fragments of the H. influenzae Rd genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       229758 gcaaatgggacaacagtaaagttatggaagaaattctgacgttacgcgttgaactggcaa 229817
